

Salesperson AI agent

Documentation: RAG Email Assistant & Sales Agent Workflow in n8n

Overview

This project consists of **two integrated workflows** in n8n:

1. **Main Email Agent Workflow:** Watches for incoming emails, processes the query, and sends responses.
 2. **Salesperson RAG Agent Workflow:** Acts as a backend knowledge agent powered by RAG (Retrieval Augmented Generation), used to fetch detailed laptop recommendations from a product database.
-

Main Email Agent Workflow

Purpose:

To automate reading emails from a Gmail inbox, process user queries via an AI agent, and respond with the most relevant product suggestions.

Workflow Steps:

1.  **Gmail Trigger (watching inbox)**
 - **Node Type:** Gmail Trigger
 - **Function:** Monitors incoming emails.
 - **Trigger:** When a new email arrives in the inbox.
2.  **Get Message (getting details)**
 - **Node Type:** Gmail - Get Message
 - **Function:** Extracts content, subject, sender email, and thread ID from the email.

3. Email Sender (AI Agent)

- **Node Type:** Agent (OpenAI)
- **Function:**
 - Processes the email text.
 - Queries the connected RAG system (Salesperson RAG Agent).
 - Generates a human-like, contextual product recommendation reply.

Connections:

- **Chat Model:** OpenAI Chat Model
- **Memory:** Postgres Chat Memory (stores conversation history)
- **Tool:** rag agent setup (connects to the RAG agent for context-aware answers)

4. Send a Message (Send a message2)

- **Node Type:** Gmail - Send Message
- **Function:** Sends a reply to the same thread using extracted thread ID and the AI-generated response.

2 Salesperson RAG Agent Workflow

Purpose:

To provide laptop suggestions using vector-based retrieval of product data + LLM response generation.

Workflow Steps:

1. When Executed by Another Workflow

- **Node Type:** Trigger
- **Function:** Triggered by the main email workflow when AI assistant needs a product recommendation.

2. Salesperson RAG Agent

- **Node Type:** Agent (OpenAI)
- **Function:** Uses tools and memory to provide AI-powered product suggestions based on user query.

Connections:

- **Chat Model:** OpenAI Chat Model
- **Memory:** Simple Memory
- **Tool:** Laptop database (calls vector search to fetch product data)

3. Laptop Database

- **Node Type:** RAG Tool
- **Function:** Connects to a vector store (Pinecone) for similarity search over laptop specs data.

4. Pinecone Vector Store

- **Node Type:** Vector Store
- **Function:** Stores vector embeddings of laptop specs.

5. Embeddings (OpenAI)

- **Node Type:** Embeddings Generator
- **Function:** Embeds all laptop product text into vectors for efficient retrieval.

6. OpenAI Chat Model1

- **Function:** Used again here to transform retrieved product data into a human-like explanation or comparison.

Technologies Used

Component	Purpose
Gmail Trigger	Capture user queries via email
OpenAI Chat Model	Answer generation

Component	Purpose
Pinecone Vector Store	Similarity-based laptop search
Postgres Chat Memory	Tracks conversation history
RAG Setup	Retrieval Augmented Generation
Embeddings OpenAI	Transforms product specs into vectors

Example Use Case

User Email:

"Can you suggest a Dell laptop with i7 processor under ₹80,000?"

AI Process:

1. Email received → parsed.
2. Query forwarded to RAG Agent.
3. Pinecone retrieves relevant Dell laptops.
4. AI converts that into a useful recommendation.
5. AI reply emailed back to the user automatically.

Result

A smart, automated sales assistant that:

- Listens to user via email
- Processes product-related queries using AI + database search
- Replies in human-like, informative language
